

Course and Examination Fact Sheet: Spring Semester 2014

8,318: Financial Volatility

ECTS credits: 4

Overview examination/s

(binding regulations see below)

Central - Oral examination (individual examination) (70%, 15 mins.)

Decentral - Group examination paper (30%)

Attached courses

Timetable -- Language -- Lecturer

[8,318,1.00 Financial Volatility](#) -- English -- [Audrino Francesco](#)

Course information

Course prerequisites

Basic knowledge in Statistics, Econometrics, and Linear Time Series Analysis.

Course content

Prices of commodities or assets produce what is called time-series. Different kinds of financial time-series have been recorded and studied for decades. Nowadays, all transactions on a financial market are recorded, leading to a huge amount of data available, either for free in the Internet or commercially. Financial time-series analysis is of great interest to practitioners as well as to theoreticians, for making inferences and predictions. Furthermore, the stochastic uncertainties inherent in financial time series and the theory needed to deal with them make the subject especially interesting not only to economists, but also to statisticians and physicists.

One of the most important common features exhibited by financial time series is time-varying volatility. Time-varying volatility refers to the tendency of small values to be followed by small values and large values to be followed by large values. It is now 20 years since the publication of Engle's (1982) seminal paper, which introduced ARCH to the world. The ARCH model was the first published paper that considered a parametric model for volatility. It had an enormous influence on both theoretical and applied econometrics, and was influential in the establishment of the discipline of Financial Econometrics.

In this lecture I provide an introduction to the subject of modeling and forecasting financial volatility, starting from the univariate and multivariate ARCH/GARCH classes of models (and their extensions) to models for stochastic volatility and realized volatility. Recent tests proposed to evaluate differences in the forecasting ability of two or more competitive approaches are also reviewed.

Course structure

A. Financial time series and their characteristics.

Asset returns; Distributional properties of returns; Stationary Processes; ARMA and ARIMA models; Random Variance Models.

B. Univariate conditional heteroskedastic models

ARCH/GARCH: properties; estimation; testing for ARCH effects; prediction.

C. Extensions of univariate ARCH/GARCH models

Exponential GARCH; Threshold GARCH; Asymmetric Power GARCH; Semi- and non-parametric ARCH; Long-memory GARCH; Markov-Switching ARCH/GARCH; Varying coefficient GARCH.

D. Multivariate GARCH models

Overview of existing models; BEKK; CCC; DCC; estimation; diagnostic checking.

E. Alternative approaches

Stochastic volatility: Introduction and overview.

Realized volatility: Introduction; definition; measures; microstructure noise; HAR-type models.

F. Evaluating volatility and correlation forecasts

Direct/Indirect comparisons of volatility forecasts; pairwise vs. multi-models comparisons; robust comparisons; Reality Check test; MCS.

G. Financial applications.

Extreme values, quantiles, and risk measures.

Examination information

Examination part/s

1. Examination part (1/2)

Examination time and form

Central - Oral examination (individual examination) (70%, 15 mins.)

Remark

--

Examination-aid rule

Extended Closed Book

The use of aids is limited; any additional aids permitted are **exhaustively** listed under "Supplementary aids". Basically, the following is applicable:

- At such examinations, all the pocket calculators of the Texas Instruments **TI-30** series and bilingual dictionaries without hand-written notes are admissible. Any other pocket calculator models and any electronic dictionaries are inadmissible.
- In addition, any type of communication, as well as any electronic devices that can be programmed and are capable of communication such as notebooks, tablets, PDAs, mobile telephones and others, are inadmissible.
- Students are themselves responsible for the procurement of examination aids.

Supplementary aids

Bring the group examination paper to the oral exam.

Examination languages

Question language: English

Answer language: English

2. Examination part (2/2)

Examination time and form

Decentral - Group examination paper (30%)

Remark

--

Examination-aid rule

Term papers

- Term papers must be written without anyone else's help and in accordance with the known quotation standards, and they must contain a declaration of authorship.
- The documentation of sources (quotations, bibliography) has to be done throughout and consistently in accordance with the APA or MLA standards. The indications of the sources of information taken over verbatim or in paraphrase (quotations) must be integrated into the text in accordance with the precepts of the applicable quotation standard, while informative and bibliographical notes must be added as footnotes (recommendations and standards can be found, for example, in METZGER, C. (2010), *Lern- und Arbeitsstrategien* (11. Aufl.). Aarau: Sauerländer).
- For any work written at the HSG, the indication of the page numbers both according to the MLA and the APA standard is never optional.
- Where there are no page numbers in sources, precise references must be provided in a different way: titles of chapters or sections, section numbers, acts, scenes, verses, etc.
- For papers in law, the legal standard is recommended (by way of example, cf. FORSTMOSER, P., OGOREK R. und VOGT H. (2008, *Juristisches Arbeiten: Eine Anleitung für Studierende* (4. Auflage), Zürich: Schulthess, or the recommendations of the Law School).

Examination languages

Question language: English

Answer language: English

Examination content

A. Financial time series and their characteristics.

Asset returns; Distributional properties of returns; Stationary Processes; ARMA and ARIMA models; Random Variance Models.

B. Univariate conditional heteroskedastic models

ARCH/GARCH: properties; estimation; testing for ARCH effects; prediction.

C. Extensions of univariate ARCH/GARCH models

Exponential GARCH; Threshold GARCH; Asymmetric Power GARCH; Semi- and non-parametric ARCH; Long-memory GARCH; Markov-Switching ARCH/GARCH; Varying coefficient GARCH.

D. Multivariate GARCH models

Overview of existing models; BEKK; CCC; DCC; estimation; diagnostic checking.

E. Alternative approaches

Stochastic volatility: Introduction and overview.

Realized volatility: Introduction; definition; measures; microstructure noise; HAR-type models.

F. Evaluating volatility and correlation forecasts

Direct/Indirect comparisons of volatility forecasts; pairwise vs. multi-models comparisons; robust comparisons; Reality Check test; MCS.

G. Financial applications.

Extreme values, quantiles, and risk measures.

Examination relevant literature

F. Audrino, Lecture Notes.

Please note

We would like to point out to you that this fact sheet has absolute priority over other information such as StudyNet, faculty members' personal databases, information provided in lectures, etc.

When will the fact sheets become binding?

- Information about courses and examination time (central/decentral and grading form): from the start of the bidding process on 23 January 2014
- Information about decentral examinations (examination-aid rule, examination content, examination relevant literature): after the 4th semester week on 17 March 2014
- Information about central examinations (examination-aid rule, examination content, examination relevant literature): from the start of the enrolment period for the examinations on 7 April 2014

Please look at the fact sheet once more after these deadlines have expired.
